## A wide range of Orbital Motors

### Orbital Motors Introduction

Danfoss is a world leader within production of low speed orbital motors with high torque. We can offer more than 3000 different orbital motors, categorized in types, variants and sizes (including different shaft versions).

The motors size vary (rated displacement) from 8 to 800 cm<sup>3</sup> [0.50 to 48.9 in<sup>3</sup>] per revolution.

- Small sized motors:
  - OML and OMM
- Medium sized motors:
  - OMP, OMR and OMH
  - OMP X and OMR X
  - DH and DS
  - OMEW
- Large sized motors:
  - OMS, OMT and OMV
  - TMK
  - TMT
  - TMTHW
  - TMVW

Speeds range up to approximate 2500 min<sup>-1</sup> (rpm) for the smallest type and up to approximate 600 min<sup>-1</sup> (rpm) for the largest type.

Maximum operating torques vary from 13 to 4000 N·m [115 to 35 400 lb·in] (peak) and maximum outputs are from 2.0 to 95 kW [2.7 to 128 hp].

*Wide range of Danfoss orbital motors*

### Orbital Motors Features

- Smooth running over the entire speed range
- Constant operating torque over a wide speed range
- High starting torque
- High return pressure without the use of drain line (high pressure shaft seal)
- High efficiency

## A wide range of Orbital Motors

- High radial and axial bearing capacity
- Long life under extreme operating conditions
- Robust and compact design

The bar diagrams above are useful for a quick selection of relevant motor size for the application. The final motor size can be determined by using the function diagram for each motor size.

- OMP and OMPW: see [OMP function diagrams](#)
- OMR and OMRW: see [OMR function diagrams](#) on page 58
- OMH: see [OMH function diagrams](#) on page 92

The function diagrams are based on actual tests on a representative number of motors from our production. The diagrams apply to a return pressure between 5 and 10 bar. [75 and 150 psi] when using mineral based hydraulic oil with a viscosity of 35 mm<sup>2</sup>/s [165 SUS] and a temperature of 50°C [120°F]. For further explanation concerning how to read and use the function diagrams, please consult the paragraph "Selection of motor size" in the technical information *General Orbital Motors* 520L0232.

## OMP versions and code numbers

This section shows the different versions/configuration codes and the ordering numbers.

- Section [OMP technical data](#) on page 14, specify the technical data for OMP X for each shaft type.
- In section [OMP function diagrams](#) on page 24, the diagram for each motor size is shown.
- See [OMP dimensions](#) on page 34 for outer main dimensions for the different OMP X motor types.

The permissible radial shaft load ( $P_R$ ) depends on: a distance from the point of load to the mounting flange ( $L$ ), speed ( $n$ ), mounting flange and shaft version.

other shaft versions

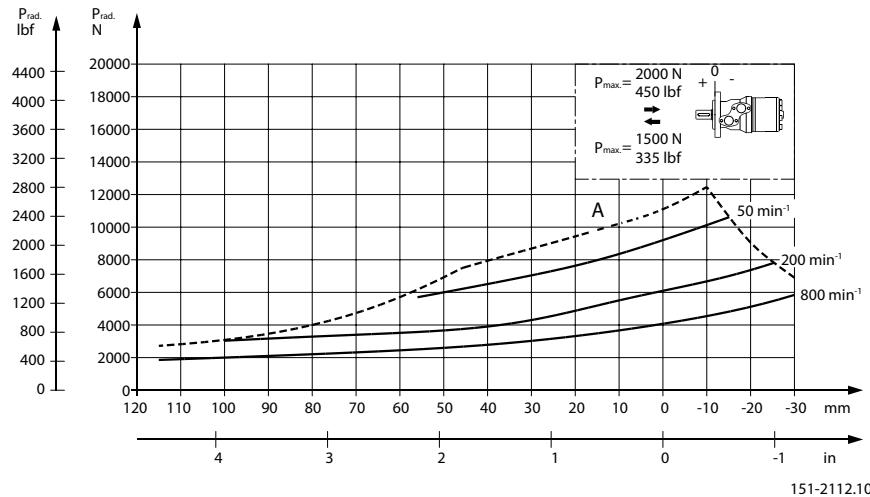

The curve shows the relation between  $P_R$  and  $n$ :

- when  $l = 30 \text{ mm}$  [1.18 in] for motors with A2 (European version) and A4 oval mounting flange
- when  $l = 24 \text{ mm}$  [0.94 in] for motors with square mounting flange and A2 (US version)

For applications with special performance requirements we recommend OMP and OMR with the output shaft running in needle bearings.

## OMP technical data

### OMP N shaft loads

The output shaft on OMP N can be offered in needle bearings. These bearings and the recessed mounting flange allow a higher permissible radial load in comparison to OMP motors.

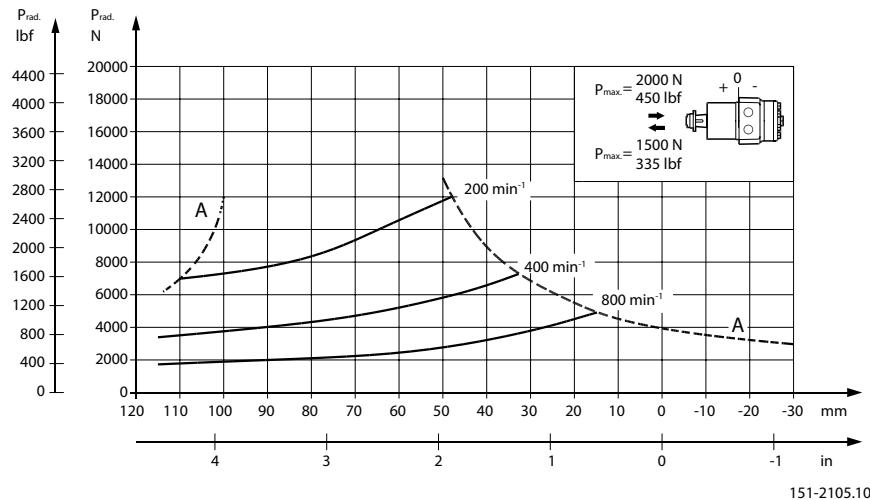

The permissible radial load on the shaft is shown for different speeds as a function of the distance from the mounting flange to the point of load application.

Curve A indicates the max. radial shaft load. Any shaft load exceeding the values quoted in curve A will involve risk of breakage.

The other curves apply to a  $B_{10}$  bearing life of 2000 hours at the number of revolutions indicated by the curve letter. Mineral based hydraulic oil with a sufficient content of anti-wear additives must be used.

Bearing life calculations can be made using the explanation and formula provided in the chapter "Bearing dimensioning" in the technical information *General Orbital Motors, BC00000083*.

### OMPW with slide bearings shaft loads

The output shaft on OMPW can be offered in slide bearings similar to the other OMP motors. The permissible higher radial load is therefore due to the recessed mounting flange moving the point of load closer to the motor bearings.

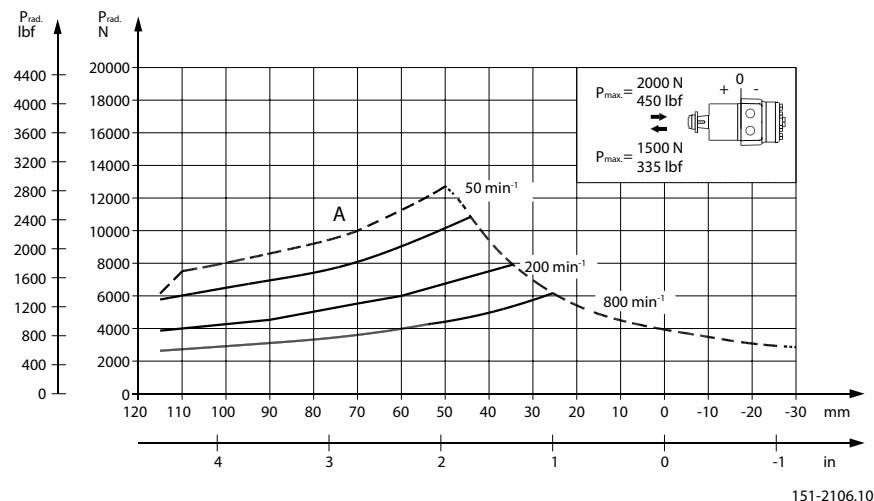

The permissible radial load on the shaft is shown for different speeds as a function of the distance from the mounting flange to the point of load application.

## OMP technical data

The curves are not based on calculations of B10 bearing life. They represent absolute limits that must not be exceeded.

Curve A indicates the max. radial shaft load. Any shaft load exceeding the values quoted in curve A will involve risk of breakage.

### OMPW N with needle bearing shaft loads

The output shaft on OMPW N can be offered in needle bearings. These bearings and the recessed mounting flange allow a higher permissible radial load in comparison to OMP motors.

The permissible radial load on the shaft is shown for different speeds as a function of the distance from the mounting flange to the point of load application.

Curve A indicates the max. radial shaft load. Any shaft load exceeding the values quoted in curve A will involve risk of breakage.

The other curves apply to a  $B_{10}$  bearing life of 2000 hours at the number of revolutions indicated by the curve letter. Mineral based hydraulic oil with a sufficient content of anti-wear additives must be used.

Bearing life calculations can be made using the explanation and formula provided in the chapter "Bearing dimensioning" in the technical information *General Orbital Motors*, **BC00000083**.

## Technical data for parking brake motor OMR F, OMR NF and OMRW NF

Technical data for brake motor		
Holding torque <sup>1)</sup>	N·m [lbf·in]	400 [3540]
Min. release pressure <sup>2)</sup>	bar [psi]	21 [305]
Max. pressure in brake line	bar [psi]	200 [2900]

<sup>1)</sup> This brake is to be used only as a passive parking brake. It may not be used for dynamic braking.

<sup>2)</sup> Brake motors must always have a drain line. The brake release pressure is the difference between the pressure in the brake release line and the pressure in the drain line.

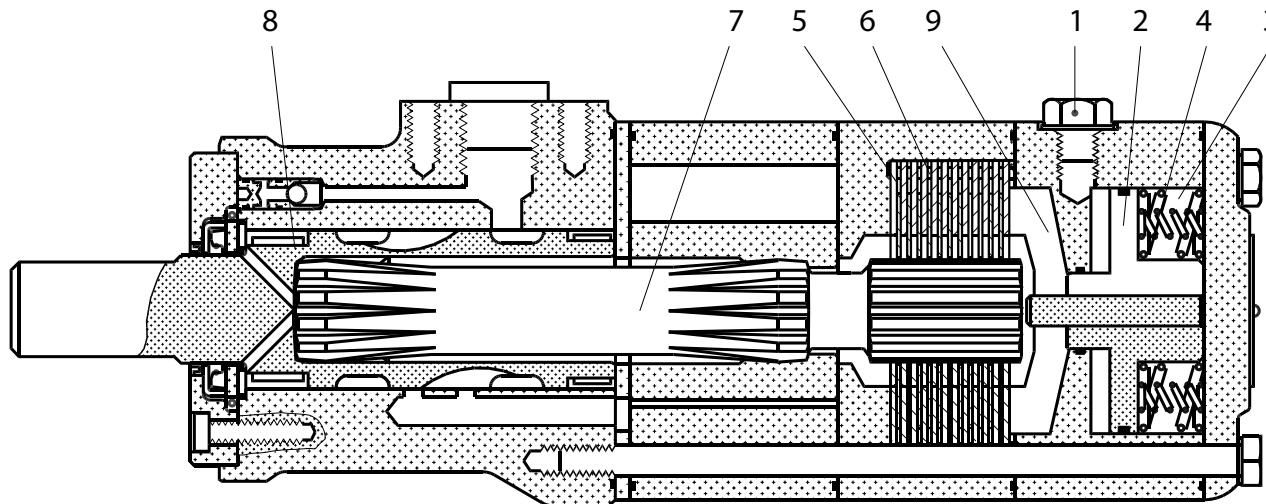

## OMR F function

In normal condition where there is no pressure on the integrated brake in OMR, i.e. the brake is applied. The brake is released when hydraulic pressure of 21 bar [300 psi] min. is applied to the brake release port (1).

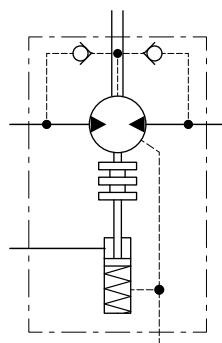

The pressure forces the piston (2) against the springs (3 and 4) disengaging the outer and inner discs (5 and 6) from each other so that the cardan shaft (7) and consequently output shaft (8) become free to rotate.

If the pressure on the brake release port is reduced to less than 21 bar [300 psi], the springs force the piston and pressure pad (9) against the brake discs and the cardan shaft/output shaft begin to lock up.

### OMR N and OMR NF with needle bearings shaft loads

151-2112.10

The output shaft on OMR N and OMR NF runs in needle bearings. These bearings and the recessed mounting flange allow a higher permissible radial load in comparison to OMR motors with slide bearings.

The permissible radial load on the shaft is shown for different speeds as a function of the distance from the mounting flange to the point of load application.

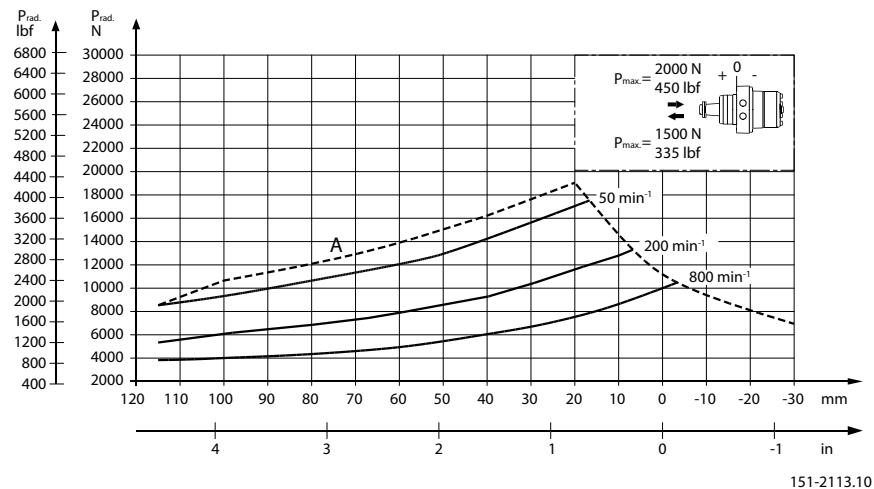

## OMR technical data

Curve A indicates the max. radial shaft load. Any shaft load exceeding the values quoted in curve A will involve risk of breakage.

The other curves apply to a  $B_{10}$  bearing life of 2000 hours at the number of revolutions indicated by the curve letter. Mineral based hydraulic oil with a sufficient content of anti-wear additives must be used.

Bearing life calculations can be made using the explanation and formula provided in the chapter "Bearing dimensioning" in the technical information *General Orbital Motors*, **BC00000083**.

### OMRW N and OMRW NF with Needle Bearings

151-2113.10

The output shaft on OMRW N runs in needle bearings. These bearings and the recessed mounting flange allow a higher permissible radial load in comparison to OMR motors with slide bearings.

The permissible radial load on the shaft is shown for different speeds as a function of the distance from the mounting flange to the point of load application.

OMH with standard shaft seal, check valves and with drain connection:

The shaft seal pressure equals the pressure on the drain line.

**Permissible shaft loads**
**OMH permissible shaft loads**

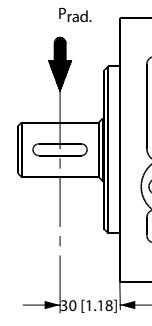

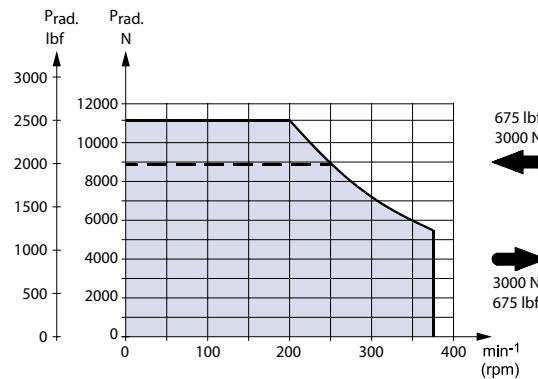

The permissible shaft load ( $P_{rad}$ ) is calculated from the speed (n) and the distance (l) between the point of load application and the mounting flange.

$$P_{rad} = \frac{1100}{n} \cdot \frac{250000}{103.5 + l} \quad N^*; l \text{ in mm}$$

$$P_{rad} = \frac{1100}{n} \cdot \frac{2215}{4.07 + l} \quad lbf^*; l \text{ in inch}$$

\* $n > 200 \text{ min}^{-1}$  (rpm);  $l < 60 \text{ mm}$  [2.36 in]

$n < 200 \text{ min}^{-1}$  (rpm);  $\Rightarrow PR_{max} = 11000 \text{ N}$  [2475 lbf]

The drawing shows the permissible radial load when  $l = 30 \text{ mm}$  [1.18 in].

## OMH function diagrams

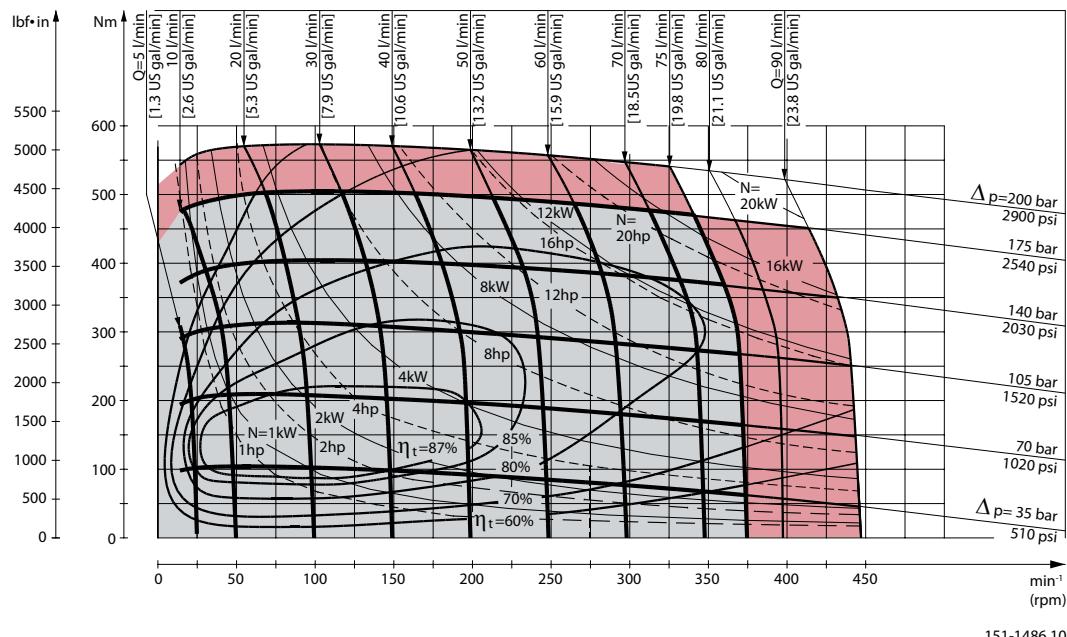

Explanation of function diagram use, basis and conditions can be found in [Speed, torque and output](#) on page 8.

- Continuous range
- Intermittent range (max. 10% operation every minute)

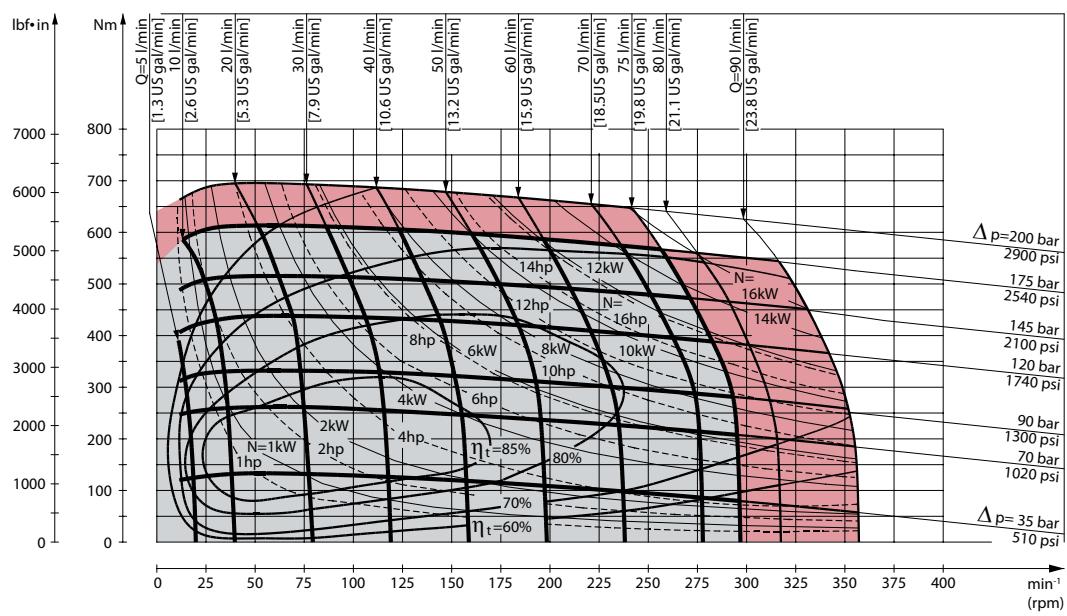

Maximum permissible continuous/intermittent pressure drop for the actual shaft version can be found in [OMH technical data](#) on page 87.

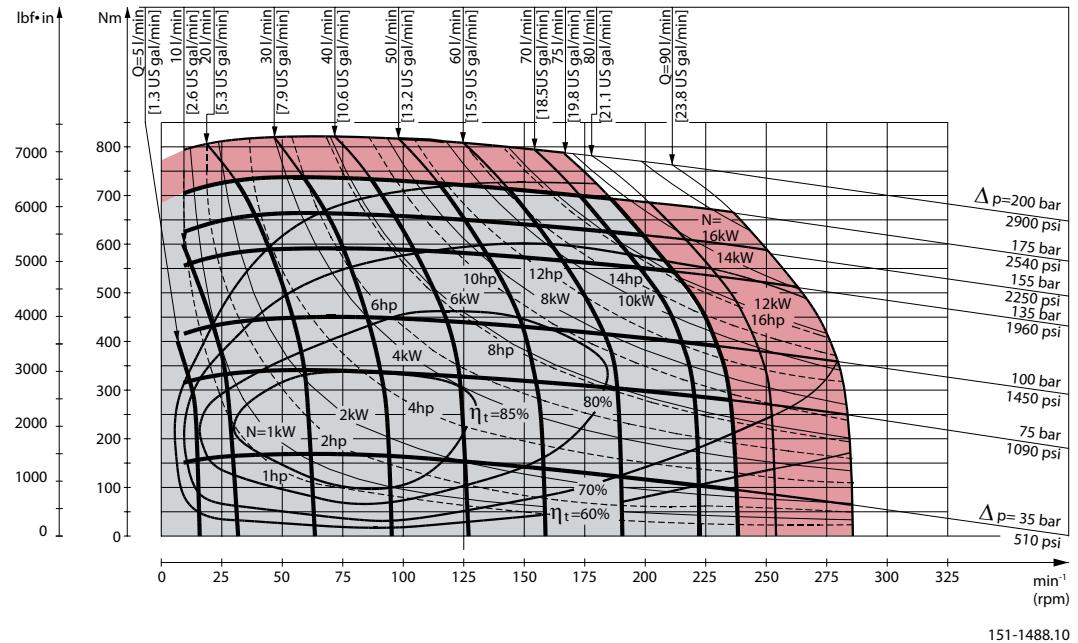

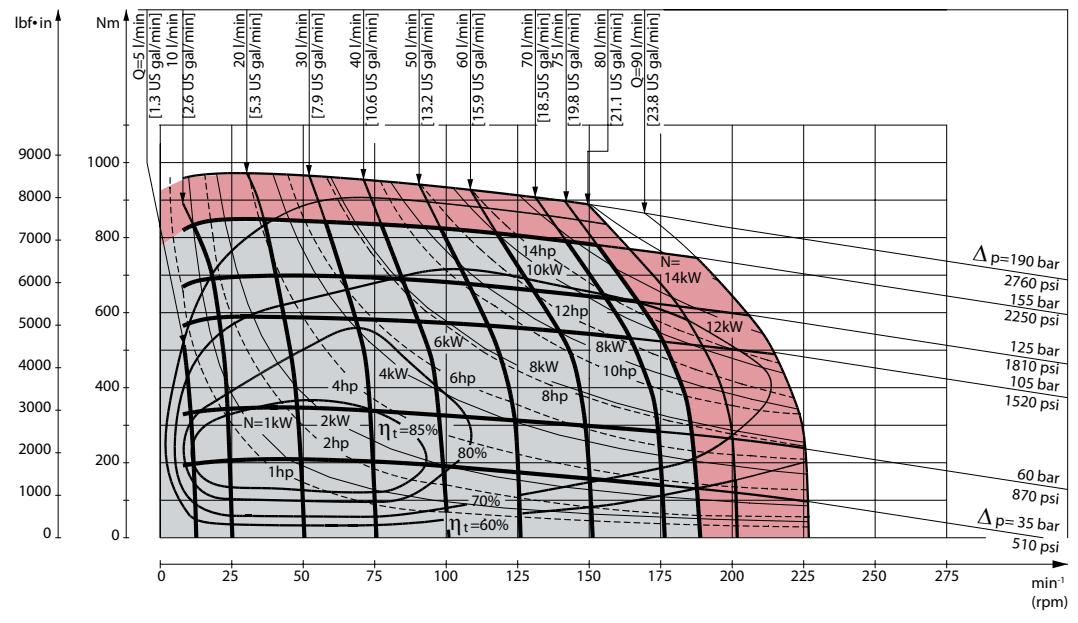

Intermittent pressure drop and oil flow must not occur simultaneously.
